Handout Kuliah Minggu 9: INTERAKSI ANTAR SPESIES - PARASITISME, PENYAKIT, MUTUALISME

Pokok Bahasan Kuliah:

I. PARASITISME & PENYAKIT

PARASITISME SEBAGAI BENTUK INTERAKSI

KLASIFIKASI & PENGERTIAN

- Simbion, parasit, patogen, parasitoid
- Mikroparasit vs. makroparasit
- Ektoparasit vs. endoparasit
- Holoparasit vs hemiparasit

SIKLUS HIDUP PARASIT YANG KOMPLEKS (contoh-contoh)

MEKANISME PERTAHANAN INANG

EFEK EKOLOGIS PARASITISME

DINAMIKA & PENYEBARAN PENYAKIT

II. MUTUALISME

MUTUALISME SEBAGAI BENTUK INTERAKSI

- Beberapa generalisasi
- Manfaat mutualisme

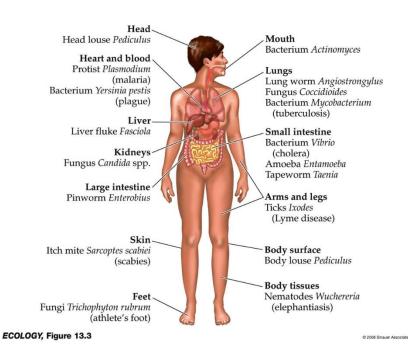

TIPE DAN CONTOH MUTUALISME

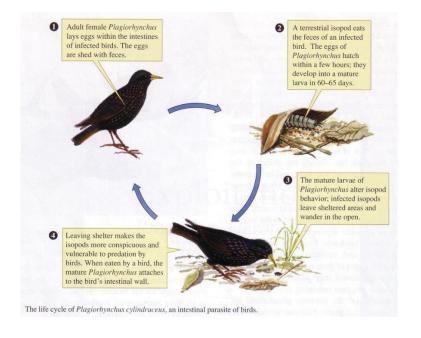

- Mutualisme tumbuhan dan hewan: penyerbukan, pemencaran
- Mutualisme untuk memperoleh nutrien: mikoriza, Rhizobium, lumut kerak, karang
- Mutualisme untuk pertahanan

MODEL MATEMATIS MUTUALISME

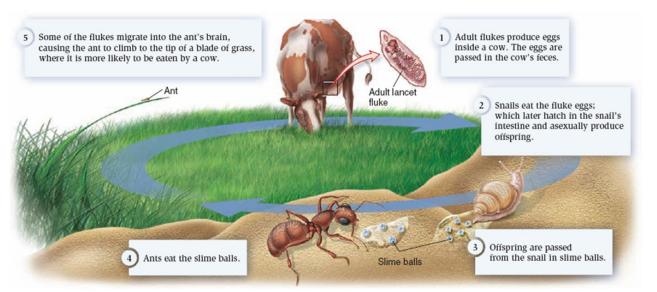

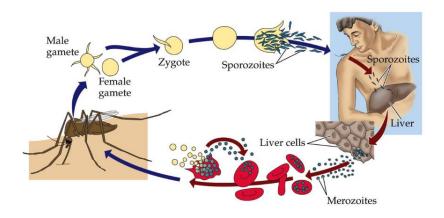

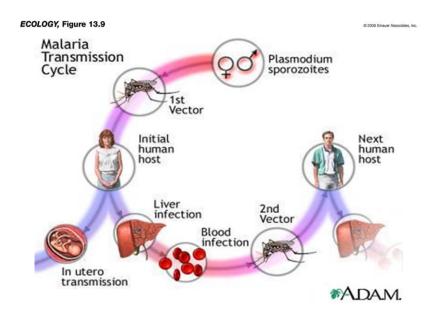

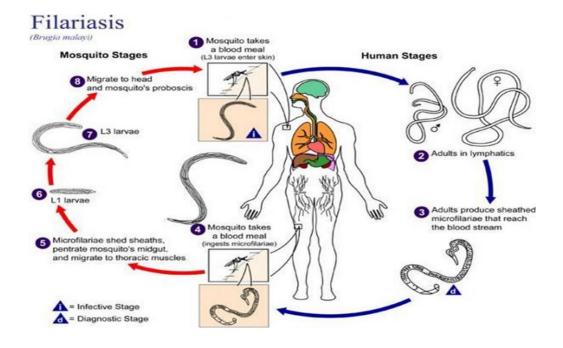

Figure 15.5 Parasite life cycles can be complex. The life cycle of the lancet fluke, Dicrocoelium dendriticum, involves behavioral changes in ants, one of its three hosts, that increase its transmission rate.

(A) Females from control populations

100

| Semales from control populations | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100 | 100

Figure 13.14 (Part 1)

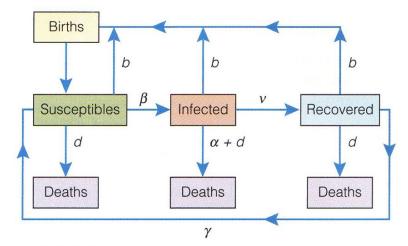

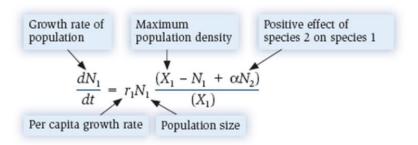

FIGURE 15.1

Compartment model for a directly transmitted microparasitic infection such as measles. Hosts are divided into susceptibles, infected, and recovered and immune. The parameters controlling this simple model are in the natural birth (b) and death (d) rates of the host, and the parameters of the disease agent: disease-induced deaths (α), recovery rate (ν), transmission rate (β) and rate of loss of immunity (γ). (From Anderson and May 1979.)

and

$$\frac{dN_2}{dt} = r_2 N_2 \frac{(X_2 - N_2 + \beta N_1)}{(X_2)}$$

where α and β are the positive effects of species 2 on species 1 and of species 1 on species 2, respectively, and are better termed mutualism coefficients. In this situation, the maximal population density when each species is alone is represented by X, not K, because such densities no longer represent real carrying capacities. The reason is that although there is a carrying capacity, K, while a mutualist is alone, the presence of its fellow mutualist can increase the carrying capacity.
